Skills

Current student of the Bachelor's Degree in Engineering in Information Technology and Digital Innovation, focused on backend development, API consumption, and relational database modeling.

I have designed and collaborated on the development of projects to improve areas with low technological impact (Sectors: agriculture, food service, and scientific research) using tools such as Java and Kotlin.

Project Development Experience

RestApp (2025–July)

The goal of the app was to manage order-taking in restaurants and streamline the organization of order information.

I developed a REST API that handles order requests, bill calculations, and sales statistics per table, using tools such as Java with Javalin.

Biodex (2025–September)

The app was designed for the collection and organization of data in the scientific field (Entomology), aiming for more explicit data collection.

I developed a REST API for creating insect specimen collections, creating virtual exhibitions, and creating specimen records, using tools such as Kotlin with Ktor.

AgroSoft (2026–February)

A project designed especially for independent agricultural users and agronomy students at the UNACH school, for crop registration and streamlined information management, implementing an external AI API for predicting crop care and growth stages.

I developed the database modeling and collaborated on developing a REST API for creating crops, crop stages, and irregularities, reducing processing time by 25%.

Education

Universidad Politécnica de Chiapas

Bachelor's Degree in Engineering in Information Technology and Digital Innovation

Suchiapa, Chiapas. | 2024 – Present.

Skills and Technologies

Languages: Java, Kotlin, Python, and C++.

Frameworks: Spring Boot, Javalin, Django, and Ktor.

Databases: MySQL and PostgreSQL.

Tools: Git, GitHub, Postman, Docker, and LaTeX.
